Who Owns Your Work?
Copyright in the Digital Age
Who Owns Your Work?
Exploring Copyright in the Digital Age

In an academic setting, publishing is essential. It enables us to communicate our research and teaching to others, to further the exploration of ideas and theories, to share discoveries and make important advances that directly impact our communities and quality of life. Ideally, publishing gives us a voice in the vast discourse of our fields. Most practically, it provides us with professional standing and enables us to pursue important advancements such as tenure. Most view publishing as the end result of months or sometimes years of toil—the products of our research and teaching.

Once our work has been accepted, especially if it is to be published by a top tier journal, we often sign whatever paper the publisher puts in front of us. It is so important that our work has made the journey from our own desktop and into the wider world to be read, discussed, and hopefully cited that most of us probably don’t even know what it is we are signing away.

I use the term “we” deliberately, to include librarians. Although open access is one of the key issues being tackled by libraries and librarians worldwide, a recent study shows that librarians are no more aware than other academic faculty of what rights they sign away, nor are they particularly motivated to publish in journals that allow them to retain their rights. According to an international study published by City University London, 13% of authors across disciplines indicated a detailed interest in copyright and intellectual property rights. These results are strikingly similar to a 2007 survey of librarians published by researchers from Southern Illinois University Carbondale, which reported that only 10% of respondents indicated such an interest.

The assertion is not that this behavior is bad or should be judged harshly; instead, the question is why do we do this? Why do authors take such little interest in the rights to their own intellectual property? And in today’s online environment, when publishing lacks some of the traditional barriers and the environment more readily supports the dissemination of information, what is the effect of this behavior? Should we be doing something different with the rights to our own work?

There is no question that in the traditional publishing market, publishers add value to authors’ work. Essentially, we sign away our rights to our work because of the efforts that publishers put into our work in return—the long, labor-intensive process of facilitating peer-review; proofreading, copy-editing, and typesetting; and marketing and distributing copies to readers. We provide the rights to our “intellectual property” and publishers provide the value of distributing our work. In turn, publishers profit from this exchange primarily by making money, and authors profit indirectly through tenure, promotion, acclaim, etc.

Copyright was born of this exchange—sort of. The printing press was introduced in England in 1476, and with it came a new way for information to be spread. It was generally in the publishing cartel’s interest to publish work that sold, even if the work presented ideas that were controversial. Yet, if work was not making it out and onto the shelves, how would the public know what was lost?

By implementing the Statute of Anne in 1709, British Parliament tried to limit the monopoly power of booksellers and limited copyright to fourteen years duration, with a possible renewal by the author for an additional fourteen years. Copyright was also extended by twenty-one years for works that were then already in copyright.

As the twenty-one year extension neared its end, a copyright war of sorts ensued. Known as the “Battle of the Book Sellers,” London publishers sought to retain their copyright in perpetuity. The publishers presented their struggle in terms of protecting the author’s rights to proprietary ownership of their work. They argued that authors should have the right not only to own, but also to sell their rights to their work in perpetuity, thus protecting the publisher’s rights to copy in perpetuity. The argument was fraught with personal tragedies where “pirates” stole works from upstanding businessmen.

In the end, the Statute of Anne precluded and copyright terms were limited to a set amount of time, after which works would transfer into the public domain. This meant that an author would always be regarded as the creator, but publishers small and large

Know Your Copyrights™
(http://www.knowyourcopyrights.org/)
A guide for educators using copyrighted works in academic settings.

Copyright Permission Assistance Available to CSU Faculty and Staff
Photocopying or other reproduction of copyrighted works requires important legal issues for the University academic community. Although the Fair Use doctrine in the 1976 Copyright Act allows the use of copyright material for educational purposes, the law does not apply to many instances.

To help protect the University and help the academic community adhere to copyright law, the Department of Communications and Creative Services offers a copyright clearance and permission service to faculty and departments that print course packets and lab manuals sold out of the University Bookstore.

For more information, contact Juliana Hinrichs, copyright clearance coordinator, at (970) 491-6432 in Communications and Creative Services, or submit your course packet order online at: http://www.ccs.co.lor州.edu/order_forms/lastprint_course_packets/.
Some permissions can take six to eight weeks to receive from publishers and authors, so planning ahead is a must in the world of copyright.

could make copies of that work as long as they could afford the printing press technology. For the consumer, the expiration of copyright drastically reduced the cost of books, especially popular ones. In essence, the copyright limits greatly broadened the pool of those gaining access to knowledge. The decision broke the monopoly power of the booksellers, but also struck a balance between an author’s rights (and by extension a publisher’s rights) to profit from their creation while recognizing that knowledge is a public good. By offering a limited monopoly, publishers could profit for a time and then the works became public, more affordable, and more likely to benefit society as a whole.

In America, the Constitution gave “Congress the power to promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.” In order “to prevent the concentrated power of publishers,” the framers of the Constitution supported “a structure that kept copyrights away from publishers and kept them short,” at least for the first two hundred or so years (Lessig, 2004, p.130-131).

In America, the Constitution gave “Congress the power to promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.” In order “to prevent the concentrated power of publishers,” the framers of the Constitution supported “a structure that kept copyrights away from publishers and kept them short,” at least for the first two hundred or so years (Lessig, 2004, p.130-131).

In this market, traditional publishing still happens and copyrights are still exchanged. Each year you will probably publish one or more articles in a peer-reviewed journal this year. Chances are that your work will end up in an online version of the journal, or perhaps will only be published online when the journal publisher eliminates print versions to take advantage of the high speed and low cost afforded by the Internet. Therefore, publishing in this traditional fashion supports a broad-based dissemination of your work.

But, by giving publisher’s the rights to disseminate your work, does this exclude you from exercising your own right to share your work with students and colleagues with the ease and convenience of the digital environment? Can you send the link of your work to a listserve of your colleagues? Can you reproduce a copy of your work to share with your class? Can you post your work on a personal, departmental or university Web site? What if your library doesn’t own the journal you’ve published in? What if your colleagues’ libraries don’t own the journal you’re published in? If, a few years from now, the journal in which you’ve published goes under, what happens to your work?

Fast Forward: Publishing Goes Digital

Now it is 2007. We are all publishers. We all have the power and tools to create copies. This is not some Orwellian fantasy, this is our reality. We can all think of things, write them down, take pictures or record sounds, and transmit that information to a broad range of audiences around the world. We can send an e-mail to a listserv with a reader- ship of hundreds. We can print a thousand copies of something and have it profession- ally bound for very little money. The very article that you’re reading right now is also published online, in a blog. (You are welcome to log on and publish your thoughts on this issue for the world to read at http://lib.colostate.edu/blogs/libraryconnection/)

This in market, traditional publishing still happens and copyrights are still exchanged. Each year you will probably publish one or more articles in a peer-reviewed journal this year. Chances are that your work will end up in an online version of the journal, or perhaps will only be published online when the journal publisher eliminates print versions to take advantage of the high speed and low cost afforded by the Internet. Therefore, publishing in this traditional fashion supports a broad-based dissemination of your work.

But, by giving publisher’s the rights to disseminate your work, does this exclude you from exercising your own right to share your work with students and colleagues with the ease and convenience of the digital environment? Can you send the link of your work to a listserve of your colleagues? Can you reproduce a copy of your work to share with your class? Can you post your work on a personal, departmental, or university Web site? What if your library doesn’t own the journal you’ve published in? What if your colleagues’ libraries don’t own the journal you’re published in? If, a few years from now, the journal in which you’ve published goes under, what happens to your work?

The answers to these questions? It depends. This is not meant to make you panic. Of the 149 publishers included in the RoMEO publishers’ copyright database, approximately 78% allow you to retain those rights, including the right to self-archive (posting to a personal, departmental or university Web site). Those publishers include the American Physical Society, Elsevier, and Cambridge University Press. (You can access this list of publishers online at http://www.sherpa.ac.uk/romeo.php.)

The “Know Your Copyrights” pamphlet produced by ARL also explains that shar- ing your work with your students constitutes fair use, and is therefore allowed in the academic setting. But this also means that 22% of publishers included in the RoMEO database don’t allow you to retain these kinds of rights to your own work. Among the publishers that don’t allow you to self-archive are the American Chemical Society, the American Medical Association, and the Modern Humanities Research Association. Because the RoMEO database is not comprehensive, it is likely that other publishers also don’t allow you to retain your rights.

Almost as fast we develop information sharing technology, laws pop up to govern that technology. Copyright law is constantly shifting. In his book, Free Culture, Lawrence Lessig paints a bleak picture of how we are migrating away from a free culture that understands and values creativity and knowledge—where the best minds of the present exist because they can collaborate and build upon the creative giants of the past—toward a permission culture that seeks to define and limit the uses of culture and its future creators. In his book, Lessig outlines the ways in which the reach of copyright law has steadily expanded.

Over the last forty years, Congress has extended existing copyrights eleven times. One such addition, the Sonny Bono Copyright Term Extension Act of 1998 (CTEA), extended copyright effectively to 95 years. The law extends back to any work published after 1923 and prevents that work from passing into the public domain.

Legally, when a work passes into the public domain this means that the author is still given credit for the work, but that the work can be copied and reproduced without the specific permission of the copyright holder. As previously mentioned, in the 1800s this introduced consumer competition into the print publishing market, and the result was that copies of works such as Shakespeare’s plays could be acquired for much less money. Therefore, works in the public domain were accessible to many more people and many more people could be enriched by them. Extending copyright to 95 years greatly alters this equation, especially in the context of the Internet. For example, one could scan the Complete Poems by Charlotte Bronte (whose works are in the public domain) and make her work freely available online to anyone with an Internet connection. (Bronte would, of course, need to be given credit for her work.) However, one could not create the same type of Website using poems by William Carlos Williams, whose work is not in the public domain.

More importantly, when a work enters into the public domain, it commonly frees others to make creative or derivative works from it. Imagine, for example, if Shakespeare’s works were not in the public domain. Would the copyright holder have approved Arthur Laurents’ West Side Story or Craig Pearce’s 1996 film Romeo and Juliet? Copyright was originally intended to expire so that published works would enter into our body of knowledge and could be creatively used by anyone. However, the CTEA restricts those rights to a single copyright holder and requires that individuals who wish to use that work track down the copyright holder and get their permission to use it—nearly 100 years after the work was produced. Why?

Free Culture vs Permission Culture

Arguably, the CTEA provides important benefits to those whose works are still commercially viable. The law has enabled copyright holders who retain the rights to profitable works to make money off of them. For example, Disney still owns Mickey Mouse, and Robert Frost’s estate still owns the rights to his collection, New Hampshire. However, what about works that are no longer commercially viable? What about works that are orphaned or have gone out of print? What about works that could and should be shared with the masses? What about works that other creative minds wish to use as springboards?

Copyright requires no registration. There is no system of tracking copyright owner-ship, therefore, if someone wanted to digitize these abandoned works to make them available again to the public they would first have to track down the copyright holder, which takes a tremendous amount of time and considerable effort.

In 1930, 10,047 books were published. In 2000, 174 of those books were still in print.11 Unless it is stored in optimal conditions, the average shelf life of a book is 50-60 years. Legally, a library must go to extensive lengths to prove that it is not infringing on copyright law. The forces of copyright law and ownership and being paid for distributing intellectual property don’t balance with the free exchange of knowledge and ideas in the way Internet technology can facilitate. There is evidence of this everywhere across this discipline.

…according to a recent study conducted by the American Association for the Advancement of Science, scientists used to fear that patents would limit their access to research tools and technologies; however, that concern has been replaced by an increased difficulty in getting access to data.12 Even though Congress has repeatedly extended copyright terms over the last forty years, patent terms have been left alone and those rights expire after twenty years. The research community has long debated whether or not patents might infringe on important scientific advancement. Might this community raise the same debate around copyright, which now lasts almost a century?

The law as it stands seems also to be limiting the histories that can be told. When professors Cathy Davidson and Ada Norris sought to document the life of Yankton Nakota writer and activist Zitkala-Ša, their publisher would not even consider use of any works that fell outside of 1922, fearing the time and expense it might take to clear copyright claims.13

The law as it stands seems also to be limiting the music that can be played. Dr. Susan Pickett, Catharine Cluim Professor of Music at Whitman College writes, “I have been dealing with the problem of orphaned copyrighted works during my 15 years of research about women composers. Frankly, I can see why some people just blatantly break the law; there are so many barriers and dead ends and catch-22s that it’s frustrating beyond words even to the most law-abiding person… There needs to be an international registry of people who have legal rights over music so that it’s easier to find out whom to contact for permission” (Duke Law School, 2005, p.2).14

Something about regulating the exchange of information isn’t working, or isn’t working as efficiently as it should be. In an information age, knowledge is at our fingertips. Yet, Congress continues to enact laws that restrict access. They will continue to do this unless more people engage in the shaping of knowledge in the digital environment.

### Current Standings

Regardless of where you fall in the copyright debate or the degree to which you view knowledge as individual property, a public good, or a mix of both, the reality is that something has to be done. Working with the current state of copyright law and ownership and being paid for distributing intellectual property don’t balance with the free exchange of knowledge and ideas in the way Internet technology can facilitate. There is evidence of this everywhere across this discipline.

…according to a recent study conducted by the American Association for the Advancement of Science, scientists used to fear that patents would limit their access to research tools and technologies; however, that concern has been replaced by an increased difficulty in getting access to data.12 Even though Congress has repeatedly extended copyright terms over the last forty years, patent terms have been left alone and those rights expire after twenty years. The research community has long debated whether or not patents might infringe on important scientific advancement. Might this community raise the same debate around copyright, which now lasts almost a century?

The law as it stands seems also to be limiting the histories that can be told. Managing Your Copyright

The great value of the Internet is that having a journal publish your work is no longer the end of the story. You have the power and tools to help distribute your own work so that it can resonate in ways never before imagined. First, you have to be sure to retain at least some of your copyright during the publishing process. Here’s how:

- **Establish a Creative Commons License** ([www.creativecommons.org](http://www.creativecommons.org)). Creative commons is a nonprofit organization that helps “authors, scientists, artists, and educators easily mark their creative work with the freedoms they want it to carry.” It allows you to copyright your work while enabling people to more readily copy and distribute your work—provided they give you credit—in the ways you want them to.

- **Publish in journals that allow you to retain your rights.** This will make it possible for you to share your work in the digital environment. The RoMEO database ([http://www.sherpa.ac.uk/romeo.php](http://www.sherpa.ac.uk/romeo.php)) is a growing list of permissions that are normally given as part of each publisher’s copyright transfer agreement. It is searchable by publisher and enables you to add publishers to the list. Self-archiving (posting on a personal/departmental website or in a digital collection supported by the University) is a key right to retain so that you can create a digital copy of your own body of work.

- **Download the SPARC Author Addendum** ([http://www.arl.org/sparc/author/addendum.html](http://www.arl.org/sparc/author/addendum.html)). When added to traditional publication agreements, the addendum will help you to retain more of your own rights to your journal publications and make it possible for you to more easily control your work in the digital environment (including protecting your right for online posting or using portions of your articles in future work.)
